

HRMS SOFTWARE

PHASE 1 (MVP)

1. Executive Summary

The Human Resource Management System (HRMS) is a platform designed to automate and simplify HR operations within organizations. It helps companies manage employee data, attendance, payroll, leave management and performance evaluation through a centralized digital system.

The HRMS will be developed as a **Software as a Service (SaaS)** product. Organizations can subscribe to the platform on a monthly or yearly basis and access it through a web-based interface without installing any infrastructure.

The system will support multiple organizations using a **multi-tenant architecture**, where each company has its own isolated data environment. Phase 1 of the system will focus on a **Minimum Viable Product (MVP)** that includes essential HR functionalities required for daily operations.

2. Product Model - SaaS HRMS Platform

The HRMS platform will operate under a Software as a Service (SaaS) model, allowing organizations to use the system through a web-based interface.

Key characteristics of the SaaS model include:

- Cloud-based access from any location
- Subscription-based pricing model
- Automatic software updates and maintenance
- Centralized platform management
- Scalable architecture supporting multiple companies

Organizations can subscribe to the platform based on their needs, such as employee count or feature packages. This approach makes the system accessible for small, medium, and large enterprises.

3. System Architecture Overview

The HRMS platform will operate on a multi-tenant SaaS architecture, allowing multiple companies to use the same application while maintaining strict separation of their data. Each organization will have its own workspace within the system where it can manage employees, HR policies, payroll and attendance.

The system will follow a hierarchical structure where the Super Admin manages the platform, companies manage their employees, and employees interact with HR services through the system.

3.1 Multi-Tenant Architecture

The HRMS will operate on a multi-tenant SaaS model with the following hierarchy:

User Hierarchy

- **Super Admin Level:** Platform administrators who manage the entire system, subscription plans and company onboarding.
- **Company Level:** Organizations that subscribe to the platform and manage their own HR operations.
- **Company Admin Level:** HR administrators within each company who manage employees, payroll, attendance and HR policies.
- **Employee Level:** Employees who access the system to view HR information, apply for leave, track attendance and access payslips.

3.2 Data Isolation

Each company's data will be securely stored and completely isolated from other organizations using the platform.

For example, Company A cannot access employee records, payroll data, or HR information belonging to Company B. This ensures **data privacy, security and compliance with data protection standards**.

4. System Roles

The HRMS platform will support multiple user roles to ensure proper access control and efficient system usage.

Super Admin

The Super Admin manages the entire HRMS SaaS platform.

Responsibilities include:

- Managing registered companies
- Configuring subscription plans
- Managing billing and payments
- Monitoring platform usage
- Activating or suspending company accounts
- Managing system-wide settings

Company Admin (HR Administrator)

Company Admins manage HR operations within their organization.

Responsibilities include:

- Employee onboarding and management
- Managing attendance records
- Processing payroll

- Approving leave requests
- Managing HR policies
- Generating reports and analytics

Manager

Managers oversee team members and evaluate employee performance.

Responsibilities include:

- Approving team leave requests
- Monitoring employee attendance
- Conducting performance evaluations
- Providing feedback and ratings

Employee

Employees interact with the system through the Employee Self-Service Portal.

They can:

- View personal profile information
- Mark attendance
- Apply for leave
- Access salary payslips
- Track performance evaluations

5. Phase 1 Core Modules (MVP)

The first phase of development will include the essential modules required to manage HR operations efficiently.

5.1 Employee Onboarding

The onboarding module allows HR administrators to add and manage employee records within the system.

Features include:

- Employee profile creation
- Uploading employee documents
- Automatic employee ID generation
- Assigning departments and job roles
- Sending welcome email notifications
- Maintaining employee records

This module helps organizations maintain structured employee information from the start of employment.

5.2 Attendance Management

The attendance module records employee working hours and attendance details.

Features include:

- Daily check-in and check-out
- Attendance logs
- Shift scheduling
- Overtime tracking
- Attendance reports

Future enhancements may include integration with biometric attendance systems.

5.3 Leave Management

The leave management module allows employees to apply for leave and HR administrators to manage approvals.

Features include:

- Leave application submission
- Leave approval workflow
- Leave balance tracking
- Leave history records
- Company holiday calendar

This module ensures proper tracking of employee leave policies.

5.4 Payroll Management

The payroll module automates salary calculation and payroll processing.

Features include:

- Salary structure configuration
- Automatic payroll calculation
- Deduction management (PF, ESI, taxes)
- Bonus and allowance management
- Payslip generation
- Payroll reporting

This module helps reduce manual payroll errors and simplifies salary management.

5.5 Performance Management

The performance management module helps organizations track employee productivity and conduct appraisals.

Features include:

- Goal setting
- Performance evaluations
- Manager feedback
- Employee rating system
- Performance reports

This module supports employee development and structured performance review processes.

5.6 Employee Self-Service Portal

The Employee Self-Service Portal allows employees to manage HR-related tasks independently.

Features include:

- Viewing employee profile information
- Applying for leave
- Viewing attendance records
- Downloading payslips
- Tracking performance reviews

This reduces administrative workload for HR teams.

5.7 Reports and Analytics

The reporting module provides insights into HR operations and workforce data.

Features include:

- Employee headcount reports
- Attendance reports
- Payroll expense analysis
- Leave statistics
- Exporting reports to Excel or CSV

These reports help management make informed decisions regarding workforce planning.

6. Super Admin Features

The Super Admin is responsible for managing the overall HRMS SaaS platform.

Key capabilities include:

- Managing company registrations
- Creating and managing subscription plans
- Managing billing and payment records
- Monitoring platform usage
- Activating or suspending company accounts
- Managing global platform configurations

This role ensures the platform operates smoothly for all companies using the system.

7. Company Admin Features

Company Admins manage HR processes within their organization.

Capabilities include:

- Employee onboarding and management
- Attendance monitoring
- Leave approval management
- Payroll processing
- Department and role management
- HR reporting and analytics

Company Admins ensure efficient HR operations within the organization.

8. Security and Data Protection

Since HR systems handle sensitive employee data, the platform will implement strong security mechanisms.

Security features include:

- Role-based access control
- Secure user authentication
- Data encryption
- Secure cloud storage
- Regular data backups
- Activity monitoring and logs

These measures help protect employee data and maintain system integrity.

9. Future Scope (Phase 2)

After the successful deployment of the MVP, additional features may be introduced in future phases.

Possible enhancements include:

- Recruitment and Applicant Tracking System (ATS)
- Employee training and learning modules
- Mobile application for HRMS
- Advanced HR analytics dashboards
- AI-based HR assistant
- Biometric device integration
- Integration with accounting systems
